**COURSE TYPE**

Specialisation Course

**PREREQUISITE COURSES:**

Logic Circuit Design (3rd Semester)

**LANGUAGE OF INSTRUCTION and EXAMINATIONS:**

Greek

**IS THE COURSE OFFERED TO ERASMUS STUDENTS**

NO

**COURSE WEBSITE (URL)**

(2) LEARNING OUTCOMES

Learning outcomes

The course learning outcomes, specific knowledge, skills and competences of an appropriate level, which the students will acquire with the successful completion of the course are described.

Consult Appendix A

- Description of the level of learning outcomes for each qualifications cycle, according to the Qualifications Framework of the European Higher Education Area
- Descriptors for Levels 6, 7 & 8 of the European Qualifications Framework for Lifelong Learning and Appendix B
- Guidelines for writing Learning Outcomes

The course is based on the fundamental elements of logic circuit design offered by the prerequisite module on Logic Circuit Design and aims at the:

- consolidation of the design methodologies for combinational and sequential digital systems,
- knowledge and use of hardware description languages (VHDL) for system modeling and simulation,
- implementation of digital systems on reconfigurable programmable logic devices (CPLDs and FPGAs),
- study of different memory structures and technologies,
- experience acquisition on the complete digital system design cycle using CAD tools.

Upon successful completion of this course module students possess advanced knowledge, skills and competences in the subject of Digital Systems Design that enable them to:
• understand the functionality of digital systems,
• analyze and synthesize digital modules and circuits for a wide application range,
• design and implement hardware digital systems incorporating memory modules,
• model, simulate and implement digital circuits using hardware description languages and CAD tools,
• Interpret the specifications of programmable reconfigurable devices and select the appropriate for the application in hand.

General Competences
Taking into consideration the general competences that the degree-holder must acquire (as these appear in the Diploma Supplement and appear below), at which of the following does the course aim?

| Search for, analysis and synthesis of data and information, with the use of the necessary technology | Project planning and management |
| Adapting to new situations | Respect for difference and multiculturalism |
| Decision-making | Respect for the natural environment |
| Working independently | Showing social, professional and ethical responsibility and sensitivity to gender issues |
| Team work | Criticism and self-criticism |
| Working in an international environment | Production of free, creative and inductive thinking |
| Working in an interdisciplinary environment | Others... |
| Production of new research ideas | Others... |

• Search for, analysis and synthesis of data and information, with the use of the necessary technology
• Working independently
• Team work
• Production of free, creative and inductive thinking

(3) COURSE CONTENT

Lectures
• Introduction
  i. Hardware description languages
  ii. Logic circuit synthesis
  iii. Reconfigurable logic devices (CPLD, FPGA)
• VHDL principles
  i. Behavioral description
  ii. Structural description
• Building blocks of combinational and sequential circuits in VHDL (Logic gates, binary functions, multiplexers, flip-flops, registers, counters etc)
• Arithmetic units (Serial and parallel adder/subtractor, multiplier)
• Memory structures (RAM, ROM, EPROM, Flash).
• Synchronous sequential circuit design
• Digital system implementation technologies

Laboratory
Ten laboratory exercises covering all module topics either by using commercial CAD tools for design and simulation of digital circuits or by implementing low complexity modules on reconfigurable devices.
(4) TEACHING and LEARNING METHODS - EVALUATION

**DELIVERY**
Face-to-face, Distance learning, etc.

**USE OF INFORMATION AND COMMUNICATIONS TECHNOLOGY**
Use of ICT in teaching, laboratory education, communication with students
- Use of electronic presentation with multimedia content in class,
- Student support through the course webpage and the departmental e-learning platform,
- Electronic communication of instructors and students, through the course webpage and by e-mail.
- Use special software for modeling, simulation and implementation of digital systems in the lab.

**TEACHING METHODS**
Lectures, Laboratory experiments, study.

**STUDENT PERFORMANCE EVALUATION**
Description of the evaluation procedure

Language of evaluation, methods of evaluation, summative or conclusive, multiple choice questionnaires, short-answer questions, open-ended questions, problem solving, written work, essay/report, oral examination, public presentation, laboratory work, clinical examination of patient, art interpretation, other

Specifically-defined evaluation criteria are given, and if and where they are accessible to students.

Final course grade = Lectures part grade x 60% + Laboratory part grade x 40%

The final written exam of the theoretical part of the module includes exercises and design problems of graded difficulty. The module content as well as test examples (solved and unsolved) are available to the students through the course web page. Students are allowed to bring any related book during examination.

The evaluation of the laboratory part is performed through:
- Oral or written test during lab exercise implementation (20%),
- Mid term exam (20%)
- Final exam (60%)
